Techno Dive AS

The company was initially incorporated in 1976 under a different name, with the main product being cleaning and inspection of hulls. In the eighties, the focus shifted towards the offshore market.

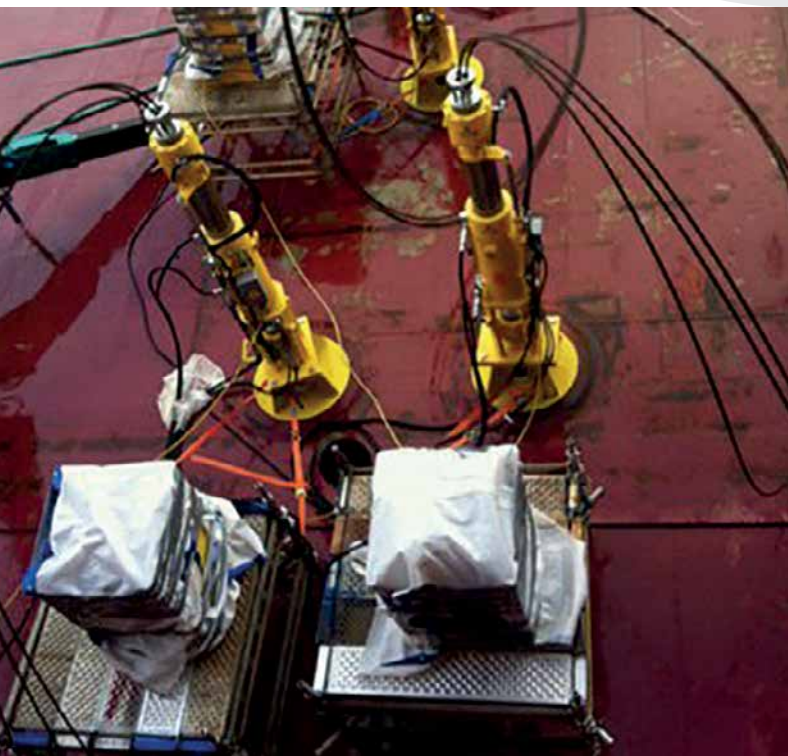

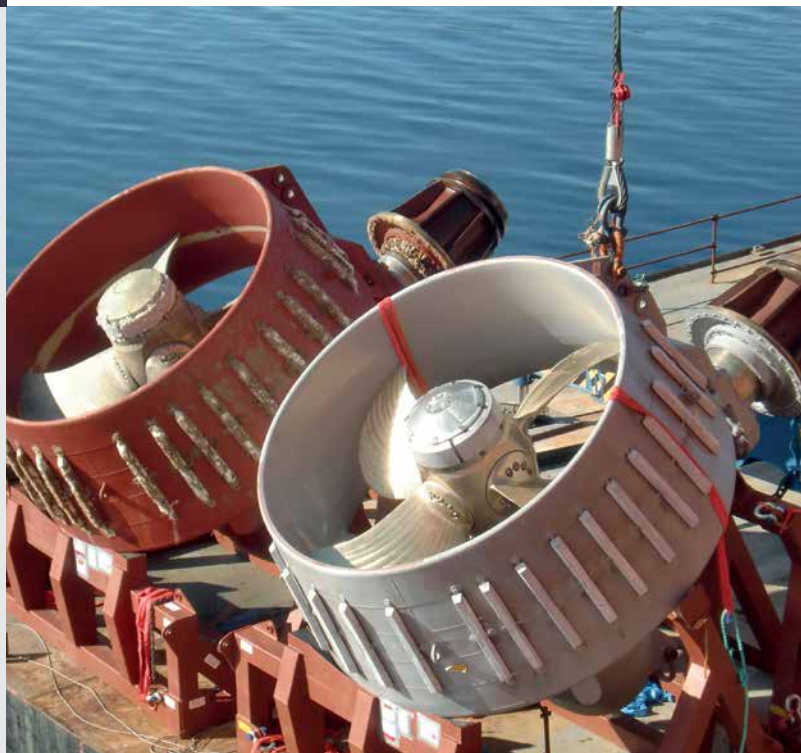

In 1985, the company moved to the west coast of Norway, Karmøy. The company continued to develop solutions for a more efficient performance of underwater mechanical work. Through product development and quality assurance of diving skilled mechanics, Techno Dive can perform a variety of underwater mechanical tasks.

We perform operations worldwide, and over the years we have developed an extensive set of products. Our speciality has become thruster change out operations.

Thruster removal/work/installation

This being our specialty, we have extensive competencies and procedures for how to replace all different types of thrusters (Azimuth, Tunnel or Podded). We also advise and recommend procedures on how to handle all operations for underwater removal/installation of thrusters.

Strand jacks

Techno Dive has two sets of Enerpac HSL300 strand jacks, which can be used in heavy lowering and lifting operations, such as removal and installation of thrusters. Strand jacks, or "wire-jekk", are computer controlled for safe and secure lifting or lowering. This gives us the accurate force recommended for each lift.

Special periodic Survey (SPS)

Techno Dive is the perfect partner for all underwater inspections, cleaning, repair work and thruster change outs. We perform mechanical work on valves, thrusters, propulsion systems, transducers and more, as defined in the SPS/ maintenance scope.

Blinding of valves and seachests Service of valves

Our task teams with divers and mechanics are ready to mobilize for international assignments with mobile diving stations, equipment and personnel on short notice. Our skilled mechanics have both experience and tools from worldwide services on valves, winches, thrusters, transducers and more.

Anode replacement

Techno Dive performs replacement of all types of anodes (including ICCP) using divers, welders and/or our specially designed cofferdams. We install anodes on hull, thrusters, seachests or elsewhere.
